Alumni Mentorship & Mock Interview Platform

Student_Mentee Client & Alumni_Mentor Client

- These are the apps/websites used by the student and the mentor to interact with the system.
- They connect to the API Gateway to send requests like login, book interview, etc.

API Gateway

- This is the single entry point through which all requests from students and mentors pass.
- It forwards each request to the correct service (auth, booking, matching, etc.) and helps in securing the system (NFR-002).

Auth & Authorization Service

- Handles login and makes sure only valid users can access the system.
- Used by almost every other service since every action needs the user to be logged in.

Profile Management Service

- Lets students and mentors create/update their profile (skills, domain, preferences).
- This profile data is later used by the Matching service to recommend mentors.

Mentor Matching & Recommendation Service

- Matches a student with suitable alumni mentors based on their profile (FR-001).
- Depends on Profile service data to give correct recommendations.

Notification Service

- Sends notifications for requests, booking confirmation, cancellation, feedback, etc. (FR-005).
- Gets triggered automatically when other services (like Feedback) complete an action.

Booking & Scheduling Service

- Handles booking a mock interview slot and checking mentor/student availability (FR-002).
- Prevents double booking by checking the Booking DB before confirming.

Meeting and Video Integration Service

- Once a booking is confirmed, this service generates the meeting link.
- Connects with an External Video Conferencing API to create the actual meeting.

Interview Recording & Feedback Service

- Stores interview recordings, scores and feedback after the mock interview (FR-003).
- Only authorized users (the concerned student/mentor) can access this data.

Review & Rating Service

- Lets students rate and review their mentor after the session (FR-004).
- Makes sure only one review is added per interview.

Data Stores (User & Profile DB, Booking & Availability DB, Feedback & Review DB)

- These are the databases where all the data gets stored permanently.
- Different services use different DBs depending on what data they need to save/fetch.

External System (Video Conferencing API, Email/SMS Gateway)

- These are outside services that the system uses for extra features.
- Video API is used for meetings, Email/SMS gateway is used for sending notifications.
